SUNNY HIGHPOWER PEAK3

Legal Provisions

The information contained in these documents is the property of SMA Solar Technology AG. No part of this document may be reproduced, stored in a retrieval system, or transmitted, in any form or by any means, be it electronic, mechanical, photographic, magnetic or otherwise, without the prior written permission of SMA Solar Technology AG. Internal reproduction used solely for the purpose of product evaluation or other proper use is allowed and does not require prior approval.

SMA Solar Technology AG makes no representations or warranties, express or implied, with respect to this documentation or any of the equipment and/or software it may describe, including (with no limitation) any implied warranties of utility, merchantability, or fitness for any particular purpose. All such representations or warranties are expressly disclaimed. Neither SMA Solar Technology AG nor its distributors or dealers shall be liable for any indirect, incidental, or consequential damages under any circumstances.

The exclusion of implied warranties may not apply in all cases under some statutes, and thus the above exclusion may not apply.

Specifications are subject to change without notice. Every attempt has been made to make this document complete, accurate and up-to-date. Readers are cautioned, however, that product improvements and field usage experience may cause SMA Solar Technology AG to make changes to these specifications without advance notice, or per contract provisions in those cases where a supply agreement requires advance notice. SMA Solar Technology AG shall not be responsible for any damages, including indirect, incidental or consequential damages, caused by reliance on the material presented, including, but not limited to, omissions, typographical errors, arithmetical errors or listing errors in the content material.

SMA Warranty

You can download the current warranty conditions from the Internet at www.SMA-Solar.com.

Software licenses

The licenses for the used software modules can be called up on the user interface of the product.

Trademarks

All trademarks are recognized, even if not explicitly identified as such. Missing designations do not mean that a product or brand is not a registered trademark.

1 Information on this Document

1.1 Validity

This document is valid for:

- SHP 100-20 (Sunny Highpower PEAK3)
- SHP 150-20 (Sunny Highpower PEAK3)

1.2 Target Group

This document is intended for qualified persons and end users. Only qualified persons are allowed to perform the activities marked in this document with a warning symbol and the caption "Qualified person". Tasks that do not require any particular qualification are not marked and can also be performed by end users. Qualified persons must have the following skills:

- Knowledge of how an inverter works and is operated
- Training in how to deal with the dangers and risks associated with installing, repairing and using electrical devices and installations
- · Training in the installation and commissioning of electrical devices and installations
- Knowledge of all applicable laws, standards and directives
- · Knowledge of and compliance with this document and all safety information

1.3 Content and Structure of this Document

This document describes the mounting, installation, commissioning, configuration, operation, troubleshooting and decommissioning of the product as well as the operation of the product user interface

You will find the latest version of this document and further information on the product in PDF format and as eManual at www.SMA-Solar.com. You can also call up the eManual via the user interface of the product.

Illustrations in this document are reduced to the essential information and may deviate from the real product.

1.4 Levels of Warning Messages

The following levels of warning messages may occur when handling the product.

A DANGER

Indicates a hazardous situation which, if not avoided, will result in death or serious injury.

A WARNING

Indicates a hazardous situation which, if not avoided, could result in death or serious injury.

A CAUTION

Indicates a hazardous situation which, if not avoided, could result in minor or moderate injury.

NOTICE

Indicates a situation which, if not avoided, can result in property damage.

1.5 Symbols in the Document

Symbol	Explanation
i	Information that is important for a specific topic or goal, but is not safety-relevant
	Indicates a requirement for meeting a specific goal
I	Desired result
×	A problem that might occur
*	Example

▲ QUALIFIED PERSON Sections describing activities to be performed by qualified persons only

2 Safety

2.1 Intended Use

The Sunny Highpower is a transformerless PV inverter that converts the direct current from the PV array into grid-compliant three-phase current. An external transformer fitted downstream feeds the alternating current generated into the utility grid.

The product is intended for use in industrial environments.

The product complies with EN 55011 of class A, group 1:

- a.c. mains power port: ≤ 20 kVA
- d.c. power port: > 75 kVA
- Electromagnetic radiation disturbance: ≤ 20 kVA

In accordance with EN 55011, the product must only be operated at locations where the distance between the product and third-party radio-communication installations is greater than 30 m.

The product is not intended to be used in living areas and cannot provide protection of radio reception against interference signals in such environments.

The product complies with IEC 60721-3-4 as per Class 4C2 and is suitable for operation in a chemically active environment.

The product is suitable for indoor and outdoor use.

The product must only be operated with PV modules of protection class II in accordance with IEC 61730, application class A. The PV modules must be compatible with this product.

The product may only be operated in connection with a suitable medium-voltage transformer. The low-voltage side must be configured in a star formation and the neutral point must be grounded (for information about the requirements of the medium-voltage transformer, consult the technical information "Important Requirements for Medium-Voltage Transformers" under www.SMA-Solar.com).

The product is not equipped with a transformer and therefore has no galvanic isolation. The product must not be operated with PV modules whose outputs are grounded. This can cause the product to be destroyed. The product may be operated with PV modules whose frame is grounded.

PV modules with a high capacity to ground must only be used if their coupling capacity does not exceed $32~\mu\text{F}$ (for information on how to calculate the coupling capacity, see the Technical Information "Leading Leakage Currents" at www.SMA-Solar.com).

All components must remain within their permitted operating ranges and their installation requirements at all times.

The product must only be used in countries for which it is approved or released by SMA Solar Technology AG and the grid operator.

Use SMA products only in accordance with the information provided in the enclosed documentation and with the locally applicable laws, regulations, standards and directives. Any other application may cause personal injury or property damage.

Alterations to SMA products, e.g., changes or modifications, are only permitted with the express written permission of and according to the instructions from SMA Solar Technology AG. Unauthorized alterations can be dangerous and lead to personal injury. In addition, an unauthorized alteration will void guarantee and warranty claims and in most cases terminate the operating license. SMA Solar Technology AG shall not be held liable for any damage caused by such changes.

Any use of the product other than that described in the Intended Use section does not qualify as the intended use.

The enclosed documentation is an integral part of this product. Keep the documentation in a convenient, dry place for future reference and observe all instructions contained therein.

This document does not replace and is not intended to replace any local, state, provincial, federal or national laws, regulations or codes applicable to the installation, electrical safety and use of the product. SMA Solar Technology AG assumes no responsibility for the compliance or non-compliance with such laws or codes in connection with the installation of the product.

The type label must remain permanently attached to the product.

2.2 IMPORTANT SAFETY INSTRUCTIONS

SAVE THESE INSTRUCTIONS

This section contains safety information that must be observed at all times when working.

The product has been designed and tested in accordance with international safety requirements. As with all electrical or electronical devices, there are residual risks despite careful construction. To prevent personal injury and property damage and to ensure long-term operation of the product, read this section carefully and observe all safety information at all times.

A DANGER

Danger to life due to electric shock when live components or DC cables are touched

When exposed to sunlight, the PV modules generate high DC voltage which is present in the DC cables. Touching live DC cables results in death or lethal injuries due to electric shock.

- Do not touch non-insulated parts or cables.
- Install external DC load-break switch (e.g., a PV junction box including a load-break switch) between the inverter and PV array.
- Disconnect the PV array from the inverter via an external DC load-break switch (e.g. via a PV junction including a load-break switch). Switch off and secure the DC load-break switch against reconnection.
- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Wear suitable personal protective equipment for all work on the product.

A DANGER

Danger to life due to electric shock from touching an ungrounded PV module or array frame

Touching ungrounded PV modules or array frames results in death or lethal injuries due to electric shock.

 Connect and ground the frame of the PV modules, the array frame and the electrically conductive surfaces so that there is continuous conduction. Observe the applicable local regulations.

A DANGER

Danger to life due to electric shock when touching live system components in case of a ground fault

If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Touch the cables of the PV array on the insulation only.
- Do not touch any parts of the substructure or frame of the PV array.
- Do not connect PV strings with ground faults to the inverter.

A DANGER

Danger to life due to electric shock in case of overvoltages and if surge protection is missing

Overvoltages (e. g. in the event of a flash of lightning) can be further conducted into the building and to other connected devices in the same network via the network cables or other data cables if there is no surge protection. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Ensure that all devices in the same network are integrated in the existing overvoltage protection.
- When laying the network cable outdoors, ensure that there is suitable surge protection at the network cable transition from the product outdoors to the network inside the building.
- The Ethernet interface of the inverter is classified as "TNV-1" and offers protection against overvoltages of up to 1.5 kV.

A WARNING

Danger to life due to fire or explosion

In rare cases, an explosive gas mixture can be generated inside the product under fault conditions. In this state, switching operations can cause a fire or explosion. Death or lethal injuries due to fire or flying debris can result.

- In case of error, only carry out corrective measures specified by SMA Solar Technology AG (see Section 12 "Troubleshooting", page 55). If no corrective measures are specified, do not perform any actions on the product. Contact the Service.
- Ensure that unauthorized persons have no access to the product.
- Disconnect the AC circuit breaker and secure it against reconnection.
- Disconnect the PV array from the product via an external disconnection device.

A WARNING

Risk of fire due to failure to observe torque specifications on live bolted connections

Failure to follow the specified torques reduces the ampacity of live bolted connections so that the contact resistances increase. This can cause components to overheat and catch fire.

- Ensure that live bolted connections are always tightened with the exact torque specified in this document.
- When working on the device, use suitable tools only.
- Avoid repeated tightening of live bolted connections as this may result in inadmissibly high torques.

A CAUTION

Risk of burns due to hot enclosure parts

Some parts of the enclosure can get hot during operation.

During operation, do not touch any parts other than the enclosure lid of the inverter.

A CAUTION

Risk of injury due to weight of product

Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.

- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.
- Transport the product using the carrying handles or hoist. Take the weight of the product into account.
- Use all carrying handles provided during transport with carrying handles.
- Do not use the carrying handles as attachment points for hoist equipment (e.g. straps, ropes, chains). Insert eye bolts into threads provided on top of the product to attach the hoist system.

NOTICE

Damage to the enclosure seal in subfreezing conditions

If you open the product when temperatures are below freezing, the enclosure seals can be damaged. Moisture can penetrate the product and damage it.

- Only open the product if the ambient temperature is not below -5 °C.
- If a layer of ice has formed on the enclosure seal when temperatures are below freezing, remove it prior to opening the product (e.g. by melting the ice with warm air). Observe the applicable safety regulations.

NOTICE

Damage to the product due to sand, dust and moisture ingress

Sand, dust and moisture penetration can damage the product and impair its functionality.

- Only open the product if the humidity is within the thresholds and the environment is free of sand and dust.
- Do not open the product during a dust storm or precipitation.
- Close tightly all enclosure openings.

NOTICE

Damage due to cleaning agents

The use of cleaning agents may cause damage to the product and its components.

• Clean the product and all its components only with a cloth moistened with clear water.

NOTICE

Damage to the inverter due to electrostatic discharge

Touching electronic components can cause damage to or destroy the inverter through electrostatic discharge.

Ground yourself before touching any component.

NOTICE

Destruction of the measuring device due to overvoltage

Only use measuring devices with a DC input voltage range of 1500 V or higher and an AC input voltage range of 600 V or higher.

13

3 Scope of Delivery

Check the scope of delivery for completeness and any externally visible damage. Contact your distributor if the scope of delivery is incomplete or damaged.

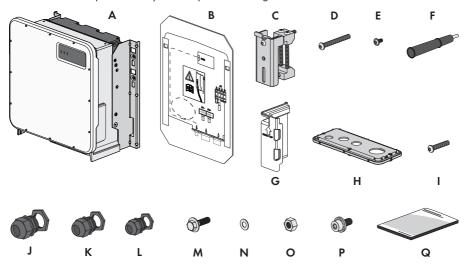

Figure 1: Components included in the scope of delivery

Position	Quantity	Designation
Α	1	Inverter
В	1	Mounting template
С	2	Mounting bracket
D	2	Button head screw M8x105
E	2	Button head screw M8x16
F	4	Carry handle
G	4	Touch protection for DC connection
Н	1	Connecting plate
I	3	Button head screw M8x70
J	1	Cable gland and counter nut M63x1.5
K	2	Cable gland and counter nut M40x1.5
L	1	Cable gland and counter nut M32x1.5
М	2	M10x40 combination hexagon head screw
N	2	Washer M10
0	2	Hexagon nut M10

Position	Quantity	Designation
P	2	M6x16 combined screw
Q	1	Quick Reference Guide

4 Additionally Required Materials and Equipment

Materials:

Material	Quantity	Explanation
Profile rail (length: min. 770 mm, depth: max. 60 mm, height: 50 mm to 80 mm)	2	For mounting the product
Terminal lugs (flange hole: M10)	2/4	For connecting the DC cables

Equipment:

-q-ip		
Equipment	Quantity	Explanation
Means of transport (e.g. pallet truck)	1	Used to transport packed product to mounting location
Utility knife	1	Used to unpack the product
Torx screwdriver (TX25)	1	Used to attach and remove transport handles and enclosure lid
Torx screwdriver (TX40)	1	Used to attach mounting brackets, inverters to mounting brackets, connecting plate to inverter; used to connect equipment grounding conductor of PV array
Allen key (AF8)	1	Used to connect AC cables
Measuring device with AC input voltage range of at least 600 V or DC input voltage range of at least up to 1500 V	1	For verifying that no voltage is present
Current clamp	1	For verifying that no voltage is present
Press tool	1	Used to attach terminal lugs to DC cables
Clean cloth	1	Used to clean terminal lugs
Ethanol cleaning agent	1	Used to clean terminal lugs
Brush	1	Used to clean aluminum conductor (only necessary if cable is made of aluminum)
Protective grease	1	Used to apply to aluminum conductor (only necessary if cable is made of aluminum)

5 Product Overview

5.1 Product Description

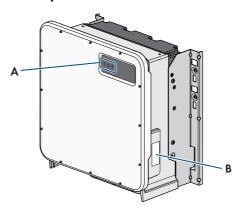

Figure 2: Design of the Product

Position	Designation
Α	LEDs
	The LEDs indicate the operating state of the inverter.
В	Type label
	The type label clearly identifies the product. The type label must remain permanently attached to the product. You will find the following information on the type label:
	Device type (Model)
	 Serial number (Serial No. or S/N)
	Date of manufacture
	Device-specific characteristics

5.2 Symbols on the Product

Symbol Beware of a danger zone This symbol indicates that the product must be additionally grounded if additional grounding or equipotential bonding is required at the installation site. Beware of electrical voltage The product operates at high voltages.

Symbol	Explanation
^	Beware of hot surface
	The product can get hot during operation.
	Observe the documentation
	Observe all documentation supplied with the product.
	Observe the documentation
i	Together with the red LED, this symbol indicates an error.
/	Inverter
~	Together with the green LED, this symbol indicates the operating state of the inverter.
4	Data transmission
	Together with the blue LED, this symbol indicates the status of the network connection.
3 ^{AC}	Three-phase alternating current without neutral conductor
DC	Direct current
X	The product is has no galvanic isolation.
	WEEE designation
	Do not dispose of the product together with the household waste but in accordance with the disposal regulations for electronic waste applicable at the installation site.
\triangle	The product is suitable for outdoor installation.
IP65	Degree of protection IP65
11 05	The product is protected against the penetration of dust and water that is directed as a jet against the enclosure from all directions.
(6	CE marking
	The product complies with the requirements of the applicable EU directives.

5.3 Interfaces and Functions

The inverter can be equipped or retrofitted with the following interfaces and functions:

User interface for monitoring and configuration

The product is equipped as standard with an integrated webserver, which provides a user interface for configuring and monitoring the product. The product user interface can be called up via the web browser if there is an existing connection to an end device (e.g. computer, tablet PC or smartphone).

Smart Inverter Screen

The Smart Inverter Screen enables you to view the status display and to display the current power and consumption on the user interface login page. You therefore have an overview of the most important inverter data without having to log into the user interface.

The Smart Inverter Screen is deactivated by default. The Smart Inverter Screen can be activated via the user interface once the inverter has been commissioned.

SMA Speedwire

The product is equipped with SMA Speedwire as standard. SMA Speedwire is a type of communication based on the Ethernet standard. SMA Speedwire is designed for a data transfer rate of 100 Mbps and enables optimum communication between Speedwire devices within systems.

SMA Webconnect

The inverter is equipped with a Webconnect function as standard. The Webconnect function enables direct data transmission between the inverter and Sunny Portal without any additional communication device and for a maximum of 4 inverters per visualized system. In PV systems with more than 4 inverters, there is the option of establishing data transmission between the inverters and Sunny Portal via the data logger (e.g., SMA Data Manager) or distributing the inverters over several systems. You can directly access your visualized system via the web browser on your end device.

Modbus

The product is equipped with a Modbus interface. The Modbus interface is deactivated by default and must be configured as needed.

The Modbus interface of the supported SMA products is designed for industrial use - via SCADA systems, for example - and has the following tasks:

- Remote guery of measured values
- Remote setting of operating parameters
- Setpoint specifications for system control

Grid management services

The product is equipped with service functions for grid management.

Depending on the requirements of the grid operator, you can activate and configure the functions (e.g. active power limitation) via operating parameters.

SMA Smart Connected

SMA Smart Connected is the free monitoring of the inverter via the SMA Sunny Portal. Thanks to SMA Smart Connected, the PV system operator and qualified person will be informed automatically and proactively about inverter events that occur.

SMA Smart Connected is activated during registration in Sunny Portal. In order to use SMA Smart Connected, it is necessary that the inverter is permanently connected to Sunny Portal and the data of the PV system operator and qualified person is stored in Sunny Portal and up-to-date.

5.4 LED Signals

The LEDs indicate the operating state of the inverter.

3			
LED signal	Explanation		
The green LED is flashing (two seconds on and two seconds off)	Waiting for feed-in conditions The conditions for feed-in operation are not yet met. As soon as the conditions are met, the inverter will start feed-in operation.		
The green LED flashes quickly	Update of central processing unit The central processing unit of the inverter is being updated.		
The green LED is glowing	Feed-in operation The inverter feeds in with a power of at least 90%.		
The green LED is pulsing	Feed-in operation The inverter is equipped with a dynamic power display via the green LED. Depending on the power, the green LED pulses fast or slow. If necessary, you can switch off the dynamic power display via the green LED.		
The green LED is off	The inverter is not feeding into the utility grid.		
The red LED is glowing	Event occurred If an event occurs, a distinct event message and the corresponding event number will be displayed in addition on the inverter user interface or in the communication product (e.g. SMA Data Manager).		
The blue LED flashes slowly for approx. one minute	Communication connection is being established The inverter is establishing a connection to a local network or is establishing a direct connection to an end device via Ethernet (e.g. computer, tablet PC or smartphone).		
The blue LED is glowing	Communication active There is an active connection with a local network or there is a direct connection with an end device via Ethernet (e.g. computer, tablet PC or smartphone).		

6 Mounting and Preparing the Connection

6.1 Requirements for Mounting

Requirements for the Mounting Location:

▲ WARNING			
Danger to life due to fire or explosion			
Despite careful construction, electrical devices can cause fires.			
Do not mount the product in areas containing highly flammable materials or gases.			
Do not mount the product in potentially explosive atmospheres.			
☐ Do not mount the inverter in living areas.			
☐ The installation site can be exposed to direct solar irradiation. There is, however, the possibility that the product reduces its power output to avoid overheating due to high temperatures.			
☐ All ambient conditions must be met (see Section 15, page 82).			
☐ At least two profile rails must be available for mounting.			
☐ The support surface of the frame to which the profile rails are attached should be firm and level (e.g. concrete). Non-fulfillment of these criteria may restrict servicing.			
Requirements for the profile rails:			
☐ The profile rails must be designed for the load and orientation of the inverters in the PV system. The profile rails might need to be reinforced.			
$\ \square$ The profile rails must be designed for the clamping range of the mounting bracket.			

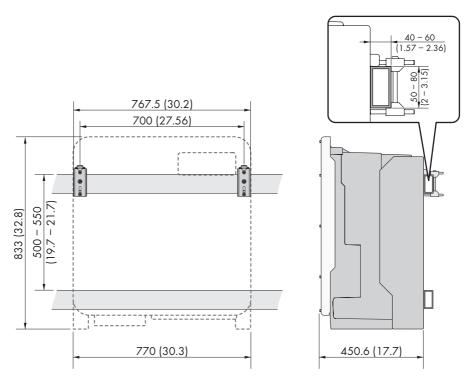

Figure 3: Dimensions of the profile rails and the clamping range of the mounting bracket (dimensions in mm (in))

Center of gravity:

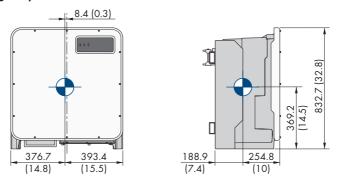

Figure 4: Dimensions of the center of gravity of the product (dimensions in mm (in))

Permitted and prohibited mounting positions:

- ☐ The product may only be mounted in a permitted position. This will ensure that no moisture can penetrate the product.
- ☐ The product should be mounted such that the LED signals can be read off without difficulty.

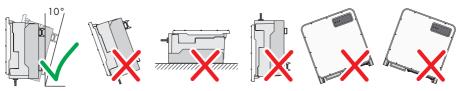

Figure 5: Permitted and prohibited mounting positions

Recommended Clearances:

If you maintain the recommended clearances, adequate heat dissipation will be ensured. Thus, you will prevent power reduction due to excessive temperature.

☐ Maintain the recommended clearances to walls as well as to other inverters or objects.

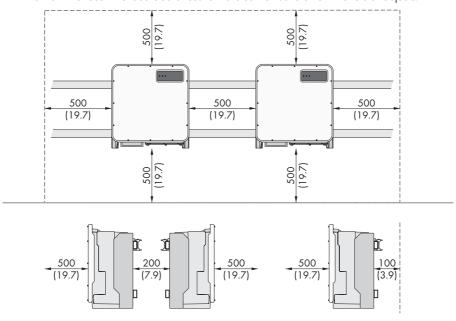

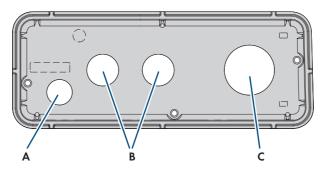

Figure 6: Recommended clearances(Dimensions in mm)

6.2 Connecting Plates Overview

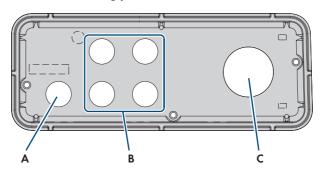

A standard connecting plate is included in the scope of delivery. Another alternative connecting plate can be purchased optionally.

Standard connecting plate

Position	Designation	
Α	Entry for network cable (M32)	
В	Entry for DC cable (M40)	
С	Entry for AC cable (M63)	

Optionally available connecting plate

Position	Designation	
Α	Entry for network cable (M32)	
В	Entry for DC cable (M32)	
С	Entry for AC cable (M63)	

6.3 Mounting the Product and Preparing the Connection

A QUALIFIED PERSON

A DANGER

Danger to life due to electric shock when live cables are touched

High voltages are present on the AC and DC cables. Touching live cables results in death or lethal injuries due to electric shock.

- Do not touch non-insulated parts or cables.
- Disconnect the AC circuit breaker and secure it against reconnection.
- Disconnect the PV array from the inverter via an external DC load-break switch (e.g. via a PV junction including a load-break switch). Switch off and secure the DC load-break switch against reconnection.
- Ensure that all cables to be connected are de-energized.
- Wear suitable personal protective equipment for all work on the product.

A CAUTION

Risk of injury due to weight of product

Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.

- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.
- Transport the product using the carrying handles or hoist. Take the weight of the product into account
- Use all carrying handles provided during transport with carrying handles.
- Do not use the carrying handles as attachment points for hoist equipment (e.g. straps, ropes, chains). Insert eye bolts into threads provided on top of the product to attach the hoist system.

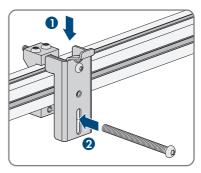

Additionally required material (not included in the scope of delivery):

☐ For transport with a hoist: 2 eye bolts (M10)

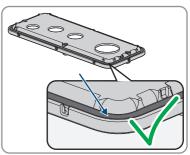

Procedure:

1. Mark the position for the mounting brackets.

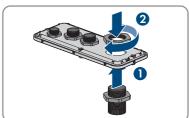

2. Hook the mounting bracket onto the mounting rail and insert the screw (M8x105).

- 3. Fasten all four screws of each mounting bracket hand-tight.
- 4. Ensure the correct position of the mounting brackets by hooking in the mounting template.
- 5. Tighten all four screws of each mounting bracket (TX40, torque: 12 Nm ± 2 Nm).
- 6. Clip the mounting template into the mounting brackets.
- 7. Align the cables by means of the mounting template and shorten if necessary. Take the product depth of 400 mm into account.
- 8. Thread the swivel nuts of the cable glands over the cables.
- Pick up the connection plate and check whether the seal is present and undamaged.

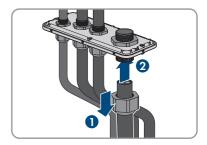

10. Attach the cable glands to the connecting plate.

2.5

 Lead the cables through the cable glands in the connecting plate and align the connecting plate by means of the mounting template.

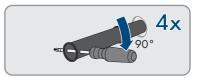

- 12. Align the connecting plate by means of the mounting template.
- 13. Remove the mounting template.

tightened.

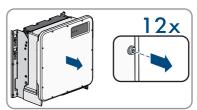

- 14. Screw the transport handles as far as they will go into the taps on the right- and left-hand side until they lie flush with the enclosure. When doing so, ensure that the transport handles are screwed into the taps so that they are perfectly straight. If the transport handles are not screwed in straight, this can make it more difficult or even impossible to unscrew them later on and can damage the taps to the extent that transport handles can no longer be screwed into them.
- screwed into them.

 15. Insert a screwdriver into the holes in the transport handle and turn the screwdriver through 90°. This ensures that the transport handles are securely

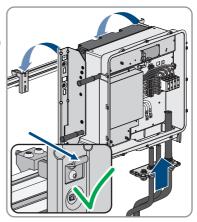

- 16. If the inverter is to be hooked into the mounting brackets by means of a hoist, screw the eye bolts into the threads on the top of the inverter and attach the hoist to them. The hoist must be suitable to take the weight of the inverter.
- Unscrew all screws of the enclosure lid (TX25) and remove it.

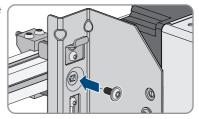

18. Set the screws and the enclosure lid aside and store safely.

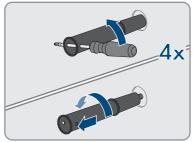

19. Hook the product into the mounting brackets. To do this, guide the product over the cables and the connecting plate so that the cables protrude through the opening into the product and the connecting plate sits under the opening. The bracket must protrude through the upper opening.

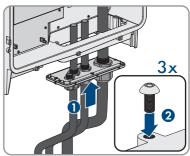

- 20. Align the cables according to the corresponding terminals and shorten the cables if necessary.
- Secure the product with one screw each on the right and left on the mounting bracket (M8x16, TX40, 12 Nm ± 2 Nm).

22. Remove all four transport handles from the threaded holes. If necessary, insert a screwdriver into the holes on the transport handle and use the screwdriver to remove the transport handle.

 Fasten the connecting plate to the enclosure using three screws (M8x70, TX40, torque: 8 Nm ± 0.5 Nm).

7 Electrical Connection

7.1 Overview of the Connection Area

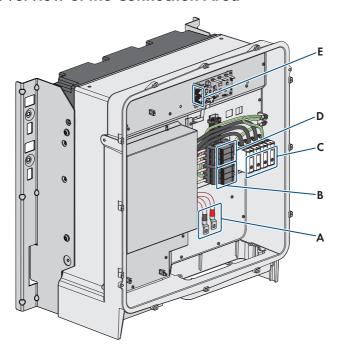

Figure 7: Connection areas in the interior of the product

Position	Designation	
A	Cable for DC connection	
В	DC overvoltage protection elements	
С	Terminal blocks for AC connection	
D	AC overvoltage protection elements	
E	Network Ports	

7.2 Connecting the AC Cable

A QUALIFIED PERSON

AC cable requirements:

П	Aluminum	or	conner	cables	must	he	used	

- ☐ The cable must be made of stranded wire or fine-stranded wire. When using fine stranded wire, bootlace ferrules must be used.
- ☐ Cable cross-section: 50 mm² to 150 mm²
- ☐ External diameter: 27 mm to 48 mm

Requirements:

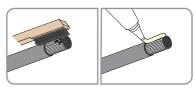

☐ A suitable medium-voltage transformer must be available.

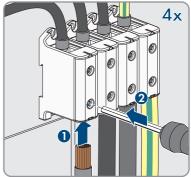

Required material (not included in the scope of delivery):

☐ Protective grease (only for conductors made of aluminum)

Procedure:

- 1. Ensure that the AC circuit breaker is switched off and that it cannot be reconnected.
- 2. Shorten the cable if necessary.
- 3. Strip the cable.
- 4. Strip off the insulation of L1, L2, L3 and grounding conductor by 30 mm (1.18 in) each.
- 5. Remove any cable remnants from the product.
- For conductors made of aluminum, remove any oxide film and apply protective grease to the conductors.
- 7. Connect PE, L1, L2 and L3 to the terminals according to the label. To do so, position each conductor as far as they will go into the corresponding terminal and tighten the screw of the terminal (AF 8, torque for a conductor cross-section of 50 mm² to 95 mm²: 20 Nm; torque for a cable cross-section of 120 mm² to 150 mm²: 30 Nm).

29

- 8. Ensure that the correct conductors are assigned to the terminals.
- 9. Make sure that all conductors are securely in place.
- 10. Firmly tighten the swivel nut on the cable gland.

7.3 Connecting the Network Cables

A QUALIFIED PERSON

A DANGER

Danger to life due to electric shock in case of overvoltages and if surge protection is missing

Overvoltages (e. g. in the event of a flash of lightning) can be further conducted into the building and to other connected devices in the same network via the network cables or other data cables if there is no surge protection. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Ensure that all devices in the same network are integrated in the existing overvoltage protection.
- When laying the network cable outdoors, ensure that there is suitable surge protection at the network cable transition from the product outdoors to the network inside the building.
- The Ethernet interface of the inverter is classified as "TNV-1" and offers protection against overvoltages of up to 1.5 kV.

Additionally required material (not included in the scope of delivery):

☐ Network cables

☐ Where required: Field-assembly RJ45 connector.

Laying the cables:

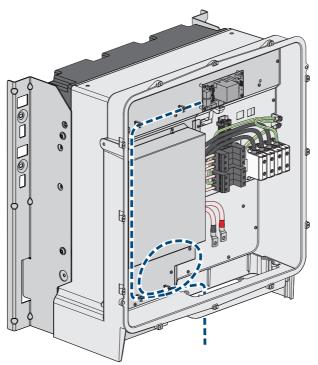

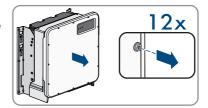

Figure 8: Interior view of the product with laying plan for network cables

Procedure:

Danger to life due to electric shock

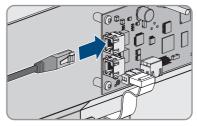

- Disconnect the inverter from all voltage sources (see Section 10, page 52).
- If the enclosure lid is closed, remove the screws of the enclosure lid (TX 25) and remove the enclosure lid.

31

- 3. When using a self-assembly network cable, assemble the RJ45 connectors and connect them to the network cable (see connector documentation).
- 4. Mount the cable gland to the connecting plate.

- 5. Route the network cable through the cable gland in the connecting plate into the inverter and lay it in the inverter and fasten to the brackets.
- Put the RJ45 plug of the cable into one of the network sockets of the communication assembly.

- 7. Ensure that the RJ45 plug is securely in place by pulling slightly on the cable.
- 8. Tighten the swivel nut on the cable gland hand-tight. This will secure the network cable in place.
- If the inverter is installed outdoors, install overvoltage protection for all components in the network.
- 10. Either connect the other end of the network cable directly to the local network (e.g. via a router) or connect all present inverters in the system to each other in line topology and connect the first or last inverter in the line to the local network.

7.4 Connecting the PV Array

A QUALIFIED PERSON

NOTICE

Damage to the inverter due to ground fault on DC side during operation

Due to the transformerless topology of the product, the occurance of ground faults on DC side during operation can lead to irreparable damage. Damages to the product due to a faulty or damaged DC installation are not covered by warranty. The product is equipped with a protective device that checks whether a ground fault is present during the starting sequence. The product is not protected during operation.

 Ensure that the DC installation is carried out correctly and no ground fault occurs during operation.

DC cable requirements:

Ш	Aluminum or copper cables must be used.
	Cable cross-section for connecting a PV combiner box: 95 mm² to 300 mm²
	Maximum cable cross-section for connecting two PV combiner boxes: 95 mm^2 to 185 mm^2
	External diameter for connecting one PV combiner box: 16 mm to 28 mm
	External diameter for connecting two PV combiner boxes: 18 mm to 25 mm
	The cables must be equipped with terminal lugs.

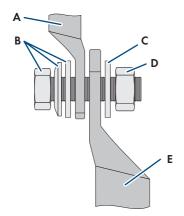

Requirements:

- ☐ Depending on the design, one or two PV combiner boxes must be present.
- \square The DC cables have been inserted into the product.

Additionally required material (not included in the scope of delivery):

- ☐ Clean cloth
- ☐ Ethanol cleaning agent
- ☐ Two or four terminal lugs (flange hole: M10, cross-section: appropriate to DC cables used)
- ☐ Press tool

DC connection overview

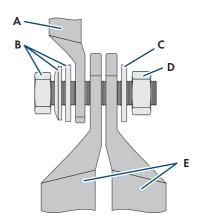

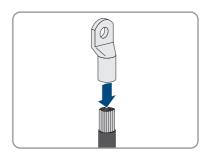

Figure 9: DC connection overview for the connection of one PV combiner box or of two PV combiner boxes

Position	Designation		
A	Pre-harnessed connection cable with terminal lug for DC connection (installed in the product)		
В	M10x40 combination hexagon head screw (AF16)		
С	Washer M10		
D	Hexagon nut M10		
Е	DC-cable with terminal lug (provided by customer)		

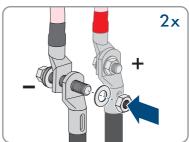

Procedure:

- 1. Ensure that no voltage is present on the DC cables.
 - Dismantle the equipment grounding conductor.
 - Attach equipment grounding conductor to terminal lug.
 - Connect the equipment grounding conductor to the equipment grounding terminal using the hexagon socket screw M6x16 (TX20, torque: 6 Nm ± 0.3 Nm).

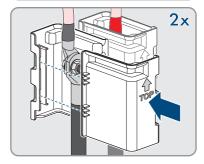

- 2. Dismantle the DC cables.
- 3. Fit terminal lugs to the DC conductors.

- 4. Remove any cable remnants from the product.
- 5. Remove the fixing of the pre-harnessed DC cables from the product.
- 6. Clean the contact surfaces of all terminal lugs using a clean cloth and ethanol cleaning agent and do not touch the contact surfaces after cleaning.
- Connect the DC cables with each other. To do this, tighten the terminal lugs with washer and screw (AF16, torque: 24 Nm ± 2 Nm). Ensure correct polarity.

 Place the touch protection elements around the terminal lugs and plug together until they audibly click into place.

9. Firmly tighten the swivel nuts of the cable glands.

8 Commissioning

8.1 Commissioning Procedure

A QUALIFIED PERSON

This section describes the commissioning procedure and gives an overview of the steps you must perform in the prescribed order.

Proced	ure	See
1.	Commission the inverter.	Section 8.2, page 35
2.	Establish a connection to the user interface of the inverter. There are various connection options to choose from for this:	Section 9.1, page 40
	Direct connection via Ethernet	
	 Connection via Ethernet in the local network 	
3.	Log into the user interface.	Section 9.2, page 42
4.	Select the inverter configuration option. Please note that the SMA Grid Guard code for changing the grid-relevant parameters must be available after completion of the first ten feed-in hours or installation assistant (see "Application for the SMA Grid Guard code" available at www.SMA-Solar.com).	Section 8.3, page 36
5.	Ensure that the country data set has been configured correctly.	Section 9.8, page 48
6.	Make further inverter settings as needed.	Section 9, page 40

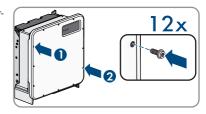

8.2 Commissioning the Inverter

A QUALIFIED PERSON

- ☐ A means of disconnecting the inverter from the PV array must be present.
- ☐ The AC circuit breaker must be correctly rated and mounted.
- ☐ The inverter must be correctly mounted.
- ☐ All cables must be correctly connected.

Procedure:

 Position the enclosure lid and first tighten the upperleft and lower-right screws, and then the remaining screws crosswise (TX25, torque: 6 Nm ± 0.3 Nm).

- 2. Switch on DC via the PV combiner box or the external DC switch.
- 3. Switch on the AC circuit breaker.
 - All three LEDs light up. The start-up phase begins.
 - All three LEDs go out again after approximately 90 seconds.
 - Depending on the available power, the green LED pulses or is continuously illuminated. The inverter is feeding in.
- 4. If the green LED is still flashing, the conditions for activating feed-in operation are not yet met. As soon as the conditions for feed-in operation are met, the inverter starts with feed-in operation and, depending on the available power, the green LED will light up continuously or it will pulse.
- If the red LED lights up, an event has occurred. Find out which event has occurred and, if necessary, initiate countermeasures.

8.3 Selecting a configuration option

A QUALIFIED PERSON

After you have logged onto the user interface as **Installer**, the **Configuring the Inverter** page opens.

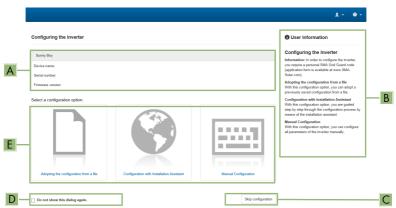

Figure 10: Layout of the Configuring the Inverter page

Position	Designation	Description	
Α	Device information	tion Provides the following information:	
		Device name	
		 Inverter serial number 	
		 Inverter firmware version 	
В	User information	Provides brief information on the listed configuration options	

Position	Designation	Description
С	Skip configuration	Offers the option of skipping the inverter configura- tion and go directly to the user interface (not recom- mended)
D	Checkbox	Allows you to choose not to have the displayed page displayed again when the user interface is called up again
E	Configuration options	Provides a selection of the various configuration options

Procedure:

On the **Configuring the Inverter** page, different configuration options are available to choose from. Select one of the options and proceed for the selected option as described below. SMA Solar Technology AG recommends carrying out the configuration with the installation assistant. This way, you ensure that all relevant parameters are set for optimal inverter operation.

- · Adoption of configuration from a file
- Configuration with the installation assistant (recommended)
- · Manual configuration

i Accepting the settings

Saving the made settings is indicated by an hourglass symbol on the user interface. If the DC voltage is sufficient, the data is transferred directly to the inverter and accepted. If the DC voltage is too low (e. g. in the evening), the settings are saved, but they cannot be directly transferred to or accepted by the inverter. As long as the inverter has not yet received and accepted the settings, the hourglass symbol will continue to be displayed on the user interface. The settings will be accepted when there is sufficient DC voltage applied and the inverter restarts. As soon as the hourglass symbol appears on the user interface, the settings have been saved. The settings will not be lost. You can log off of the user interface and leave the system.

Adopting the Configuration from a File

You can adopt the inverter configuration from a file. To do this, there must be an inverter configuration saved to a file.

Procedure:

- 1. Select the configuration option Adopting configuration from a file.
- 2. Select [Browse...] and select the desired file.
- 3. Select [Import file].

Configuring the Installation Assistant (Recommended)

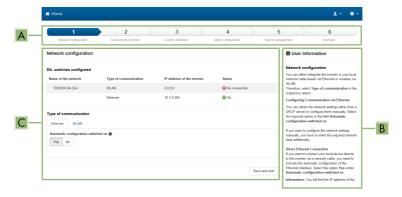

Figure 11: Layout of the installation assistant (example)

Position	Designation	Description
A	Configuration steps	Overview of the installation assistant steps. The number of steps depends on the type of device and the additionally installed modules. The current step is highlighted in blue.
В	User information	Information about the current configuration step and the setting options of the configuration step.
С	Configuration field	You can make settings in this field.

Procedure:

- 1. Select the configuration option Configuration with Installation Assistant.
 - ☑ The installation assistant will open.
- 2. Follow the installation assistant steps and make the settings appropriate for your system.
- 3. For every setting made in a step, select [Save and next].
 - ☑ In the last step, all made settings are listed in a summary.
- To save the settings to a file, select [Export a summary] and save the file on your computer, tablet PC or smartphone.
- To export all parameters and their settings, select [Export all parameters]. This exports all parameters and their settings into an HTML file.
- To correct settings you made, select [Back], navigate to the desired step, correct settings and select [Save and continue].
- 7. Once all settings are correct, select [Next] in the summary.
- ☑ The start page of the user interface opens.

Manual configuration

You can configure the inverter manually by setting the desired parameters.

39

Procedure:

- 1. Select the configuration option Manual Configuration.
 - The Device Parameters menu on the user interface will open and all available parameter groups of the inverter will be displayed.
- 2. Select [Edit parameters].
- 3. Select the desired parameter group.
 - All available parameters of the parameter group will be displayed.
- 4. Set the desired parameters.
- 5. Select [Save all].
- ☑ The inverter parameters are set.

Doguirom onto

9 Operation

9.1 Establishing a connection to the user interface

9.1.1 Establishing a Direct Connection via Ethernet

Kec	oriements.
	The product must be commissioned.
	An end device (e.g. computer) with an Ethernet interface must be available.
	The product must be connected directly to the end device.
	The respective latest version of one of the following web browsers must be installed: Chrome,
	Edge, Firefox, Internet Explorer or Safari.
	The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant

i IP address of the inverter

• Standard inverter IP address for direct connection via Ethernet: 169.254.12.3

Procedure:

 Open the web browser of your device, enter the IP address 169.254.12.3 in the address line and press the enter key.

settings after completion of the first ten feed-in hours or installation assistant (see "Application

2. i Web browser signals a security vulnerability

for SMA Grid Guard Code" at www.SMA-Solar.com).

After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.

- Continue loading the user interface.
- ☑ The login page of the user interface opens.

9.1.2 Establishing a Connection via Ethernet in the local network

i New IP address for connecting with a local network

If the product is connected to a local network (e.g. via a router), the product will receive a new IP address. Depending on the type of configuration, the new IP address will be assigned automatically by the DHCP server (router) or manually by you. Upon completion of the configuration, the product can only be reached via the following access addresses:

- Generally applicable access address: IP address manually assigned or assigned by the DHCP server (router) (identification via network scanner software or network configuration of the router).
- Access address for Apple and Linux systems: SMA[serial number].local (e.g. SMA0123456789.local)
- Access address for Windows and Android systems: https://SMA[serial number] (e.g. https://SMA0123456789)

Requirements:

The product must be connected to the local network via a network cable (e.g. via a router).
The product must be integrated into the local network. Tip: There are various methods of integrating the product into the local network with the aid of the installation assistant.
An end device (e.g. computer, tablet PC or smartphone) must be available.
The end device must be in the same local network as the product.
The respective latest version of one of the following web browsers must be installed: Chrome, Edge, Firefox, Internet Explorer or Safari.
The SMA Grid Guard code of the Installer must be available for the changing of grid-relevant settings after completion of the first ten feed-in hours or installation assistant (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

Procedure:

1. Open the web browser of your end device, enter the IP address of the inverter in the address line of the web browser and press the enter key.

2. i Web browser signals a security vulnerability

After the IP address has been confirmed by pressing the enter key, a message might appear indicating that the connection to the user interface of the inverter is not secure. SMA Solar Technology AG guarantees that calling up the user interface is secure.

• Continue loading the user interface.

☑ The login page of the user interface opens.

9.2 Logging In and Out of the User Interface

After a connection to the user interface of the inverter has been established, the login page opens. Log onto the user interface as described below.

i Usage of cookies

For the correct display of the user interface, cookies are required. The cookies are used for convenience only. By using this user interface you agree to the placement of cookies.

Log in as Installer or User for the First Time

i Password for PV systems that are registered in a communication product

The password for the user group **Installer** is also the system password. If you assign a password for the user group **Installer** via the user interface of the inverter, the password must match the PV system password. If the new password for logging onto the user interface does not match the system password in the communication product, the inverter cannot be reached by the communication product.

• A uniform password is assigned for all Speedwire devices in the PV system.

Procedure:

- 1. In the drop-down list **Language**, select the desired language.
- 2. In the **User group** drop-down list, select the entry **Installer** or **User**.
- 3. In the **New password** field, enter a new password for the selected user group.
- 4. In the **Repeat password** field, enter the new password again.
- 5. Select Login.
- ☑ The Configuring the Inverter page opens.

Log in as the User or Installer

- 1. In the drop-down list **Language**, select the desired language.
- 2. In the **User group** drop-down list, select the entry **Installer** or **User**.
- 3. Enter the password in the field **Password**.
- 4. Select Login.
- ☑ The start page of the user interface opens.

Log Out as the User or Installer

- 1. On the right-hand side of the menu bar, select the menu User Settings.
- 2. In the subsequent context menu, select [Logout].
- ☑ The login page of the user interface opens. The logout was successful.

9.3 Start Page Design of the User Interface

Figure 12: Design of the user interface's start page (example)

Posi- tion	Designation	Description
A	Menu	 Provides the following functions: Home Opens the user interface homepage Instantaneous values Current measured values of the inverter Device Parameters The various operating parameters of the inverter can be viewed and configured here depending on the user group. Events All events that have occurred in the selected time period are displayed here. The event types are Information, Warning and Error. Currently existing events of the types Error and Warning will be additionally displayed in the Device status viewlet. However, only the higher-priority event is displayed. If, for example, there is a Warning and an Error present at the same time, only the Error will be displayed. Device configuration Various settings for the inverter can be made here. The selection available is dependent on which user group you are logged in as and the operating system of the device with which the user interface has been called up. Data You will find all data that is saved in the internal memory of the inverter or on an external storage medium on this page.
В	User settings	Provides the following functions, depending on the user group logged in: Starting the installation assistant SMA Grid Guard login Logout
С	Help	Provides the following functions: • Displaying information on Open Source licenses used • Link to the website of SMA Solar Technology AG
D	Status bar	Displays the following information: Inverter serial number Inverter firmware version IP address of the inverter in the local network User group logged in Date and device time of the inverter

Posi- tion	Designation	Description
Е	Current power and current con- sumption	Temporal progression of the PV power and the power consumption of the household over the selected time period. Please note, the power consumption will only be displayed if an energy meter is installed in the PV system.
F	Status display	The various areas display information on the current status of the PV system. • Device status Displays whether the inverter is currently in a fault-free operating state or whether there is an Error or Warning present. • Current power Displays the power currently being generated by the inverter. • Yield Displays the energy yield of the inverter. • Grid supply Displays the energy supply from the utility grid. • Power at the grid-connection point Indicates which power is currently fed in or obtained at the grid-
		connection point. • Feed-in management Displays whether the inverter is currently limiting its active power or whether the active power limitation is switched off.

9.4 Displaying and Downloading the Stored Data

If an external storage device is plugged in, you can display and download the stored data.

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- 3. Select the menu Data.
- 4. Select the folder Data.
- 5. To call up the data, select the respective folder and click on the required file.
- To download the data, select the data type to be exported in the drop-down list. Then apply the time filter and select **Data export**.

9.5 Starting the Installation Assistant

A QUALIFIED PERSON

The installation assistant leads you step-by-step through the steps necessary for the initial configuration of the inverter.

Layout of the installation assistant

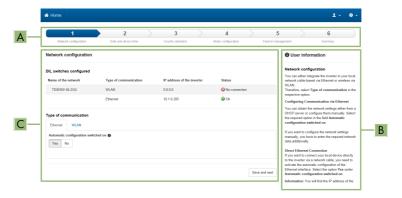

Figure 13: Layout of the installation assistant (example)

Position	Designation	Description
A	Configuration steps	Overview of the installation assistant steps. The number of steps depends on the type of device and the additionally installed modules. The current step is highlighted in blue.
В	User information	Information about the current configuration step and the setting options of the configuration step.
С	Configuration field	You can make settings in this field.

Requirement:

☐ When configuring after completion of the first ten feed-in hours or after exiting the installation assistant, the SMA Grid Guard code must be available in order to change the grid-relevant parameters (see "Application for SMA Grid Guard Code" at www.SMA-Solar.com).

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log in as Installer.
- Select the menu User Settings (see Section 9.3, page 43) on the start page of the user interface.
- 4. In the context menu, select [Starting the installation assistant].
- ☑ The installation assistant will open.

9.6 Changing the Password

The password for the inverter can be changed for both user groups. Furthermore, the user group **Installer** can change the password for the user group **User** as well as its own password.

i PV systems registered in a communication product

With PV systems that are registered in a communication product (e.g. Sunny Portal, Cluster Controller), you can also assign a new password for the user group **Installer** via the communication product. The password for the user group **Installer** is also the system password. If you assign a password for the user group **Installer** via the user interface of the inverter that does not correspond to the system password in the communication product, the inverter can no longer be reached by the communication product.

• Ensure that the password for the user group **Installer** is the same as the system password in the communication product.

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- 3. Call up the menu **Device Parameters**.
- 4. Select [Edit parameters].
- In the parameter group User Rights > Access Control change the password of the desired user group.
- 6. Select [Save all] to save the changes.

9.7 Changing Operating Parameters

The operating parameters of the inverter are set to certain values by default. You can change the operating parameters to optimize the performance of the inverter.

This section describes the basic procedure for changing operating parameters. Always change operating parameters as described in this section. Some function-sensitive parameters can only be viewed by qualified persons and can only be changed by qualified persons by entering the personal SMA Grid Guard code.

Requirements:

Changes to	grid-relevant	parameters	must k	oe approved	by th	ne responsil	ole grid	operator
Changes to	grid-relevant	parameters	must k	e approved	by th	ne responsil	ole grid	operator

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- 3. Call up the menu **Device Parameters**.
- 4. Select [Edit parameters].
- Log in using the SMA Grid Guard code to change those parameters designated by a lock (only for installers):
 - Select the menu **User Settings** (see Section 9.3, page 43).

- In the subsequent context menu, select [SMA Grid Guard login].
- Enter the SMA Grid Guard code and select [Login].
- 6. Expand the parameter group that contains the parameter which is to be configured.
- 7. Change the desired parameters.
- 8. Select [Save all] to save the changes.
- ☑ The inverter parameters are set.

i Accepting the settings

Saving the made settings is indicated by an hourglass symbol on the user interface. If the DC voltage is sufficient, the data is transferred directly to the inverter and accepted. If the DC voltage is too low (e. g. in the evening), the settings are saved, but they cannot be directly transferred to or accepted by the inverter. As long as the inverter has not yet received and accepted the settings, the hourglass symbol will continue to be displayed on the user interface. The settings will be accepted when there is sufficient DC voltage applied and the inverter restarts. As soon as the hourglass symbol appears on the user interface, the settings have been saved. The settings will not be lost. You can log off of the user interface and leave the system.

9.8 Configuring the Country Data Set

A QUALIFIED PERSON

By default, the inverter is set to a universally valid country data set. You must adjust the country data set for the installation site.

i The country data set must be set correctly.

If you select a country data set which is not valid for your country and purpose, it can cause a disturbance in the PV system and lead to problems with the grid operator. When selecting the country data set, you must always observe the locally applicable standards and directives as well as the properties of the PV system (e.g. PV system size, grid-connection point).

If you are not sure which country data set is valid for your country or purpose, contact
your grid operator for information on which country data set is to be configured.

The basic procedure for changing operating parameters is explained in another section (see Section 9.7 "Changing Operating Parameters", page 47).

Procedure:

48

 In the parameter group Grid monitoring > Grid monitoring select the parameter Set country standard and set the required country data set.

9.9 Configuring the Modbus Function

QUALIFIED PERSON

The Modbus interface is deactivated by default and the communication ports 502 set.

In order to access SMA invertes with SMA Modbus® or SunSpec® Modbus®, the Modbus interface must be activated. After activating the interface, the communication ports of both IP protocols can be changed. For information on commissioning and configuration of the Modbus interface, see the technical information "SMA and SunSpec Modbus® Interface" at www.SMA-Solar.com.

For information on which Modbus registers are supported, see the technical information "Modbus® parameters and measured values" at www.SMA-Solar.com.

i Data security during activated Modbus interface

If you activate the Modbus interface, there is a risk that unauthorized users may access and manipulate the data or devices in your PV system.

To ensure data security, take appropriate protective measures such as:

- · Set up a firewall
- Close unnecessary network ports.
- Only enable remote access via VPN tunnel.
- Do not set up port forwarding at the communication port in use.
- In order to deactivate the Modbus interface, reset the inverter to the default settings or deactivate the activated parameter again.

Procedure:

 Activate the Modbus interface and adjust the communication ports if necessary (see the technical information "SMA and SunSpec Modbus® Interface" at www.SMA-Solar.com).

9.10 Saving the Configuration in a File

You can save the current configuration of the inverter in a file. You can use this file as a data backup for this inverter and then import this file into this inverter again or another inverter from the same type or device family to configure the inverter. When saving, only the device parameters will be saved, not any passwords.

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- Select the menu Device Configuration.
- 4. Select [Settings].
- 5. In the context menu, select [Saving the configuration in a file].
- 6. Follow the instructions in the dialog.

9.11 Adopting a Configuration from a File

QUALIFIED PERSON

To configure the inverter, you can adopt the configuration from a file. To be able to do this, you must first save the configuration of another inverter from the same type or device family in a file (see Section 9.10 "Saving the Configuration in a File", page 49). When saving, only the device parameters will be adopted, not any passwords.

Requirements:

Changes to grid-relevant parameters must be approved by the responsible grid operator.
The SMA Grid Guard code must be available (see "Application for SMA Grid Guard Code"
at www.SMA-Solar.com).

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface as an Installer.
- 3. Select the menu **Device Configuration**.
- 4. Select [Settings].
- 5. In the context menu, select [Adopting the configuration from a file].
- 6. Follow the instructions in the dialog.

9.12 Updating the Firmware

A QUALIFIED PERSON

If no automatic update is set for the inverter in the communication product (e.g.

SMA Data Manager, Cluster Controller, Sunny Portal) or via the user interface of the inverter, you have the option of carrying out a manual firmware update.

You have the following options to update the firmware:

- Update the firmware with the existing update file via the user interface of the inverter.
- Search and install the firmware via the user interface of the inverter.

Update the firmware with the existing update file via the user interface of the inverter.

Requirements:

☐ An update file with the desired inverter firmware must be available. The update file is, for example, available for download on the product page of the inverter at www.SMA-Solar.com.

Procedure:

- 1. Activate the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- 3. Select the menu Device Configuration.
- 4. In the inverter row, click on the gear icon and select **Update firmware**.
- 5. Select [Browse] and select the update file for the inverter.
- 6. Select Update firmware.
- 7. Follow the instructions in the dialog.

Search and install the firmware via the user interface of the inverter.

Requirements:

☐ The inverter must be connected to the Internet

Procedure:

- 1. Open the user interface (see Section 9.1, page 40).
- 2. Log into the user interface (see Section 9.2, page 42).
- 3. Click on [Edit parameters].

- 4. Go to **Device > Update**.
- 5. Select the parameter **Check for update and install it** and set it to **Execute**.
- 6. Click on [Save all].
- ☑ The firmware is updated in the background.

10 Disconnecting the Inverter from Voltage Sources

A QUALIFIED PERSON

Prior to performing any work on the inverter, always disconnect it from all voltage sources as described in this section. Always adhere to the prescribed sequence.

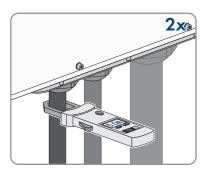

NOTICE

Destruction of the measuring device due to overvoltage

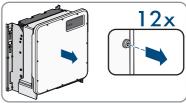

Only use measuring devices with a DC input voltage range of 1500 V or higher and an AC input voltage range of 600 V or higher.

Procedure:

- 1. Disconnect the AC circuit breaker and secure it against reconnection.
- 2. Disconnect the DC terminal of the inverter via the PV combiner box or the external DC switch.
- 3. Wait five minutes.
- 4. Wait until the LEDs have gone out.
- Use a current clamp to ensure that no current is present in the DC cables. As a result, a possible residual current can be detected.

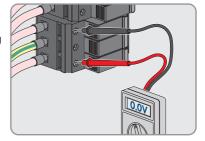

6. Unscrew all screws of the enclosure lid (TX25) and remove it

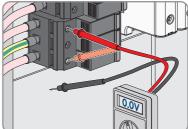

7. Set the screws and the enclosure lid aside and store safely.

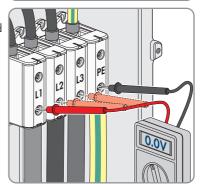

8. Ensure that no voltage is present between the positive terminal and negative terminal on the DC surge protection devices using a suitable measuring device. To do so, insert the test probe (maximum diameter: 2.5 mm) into the measuring points of the DC surge protection devices.

9. Ensure that no voltage is present between the positive terminal and ground as well as between the negative terminal and ground on the DC surge protection devices using a suitable measuring device. To do so, insert a test probe (maximum diameter: 2.5 mm) into the measuring points of the DC surge protection devices and hold the other one, for example, on the enclosure.

10. Ensure that there is no voltage on the AC terminal block between L1 and grounding conductor, L2 and grounding conductor, and L3 and grounding conductor using a suitable measuring device. To do so, insert the test probe (maximum diameter: 2.5 mm) into the measuring points of the respective terminal blocks.

53

11 Cleaning the Inverter

NOTICE

Damage due to cleaning agents

The use of cleaning agents may cause damage to the product and its components.

- Clean the product and all its components only with a cloth moistened with clear water.
- Ensure that the inverter is free of dust, foliage and other dirt.

5.5

12 Troubleshooting

12.1 Forgotten Password

If you have forgotten the password for the inverter, you can unlock the inverter with a Personal Unlocking Key (PUK). For each inverter, there is one PUK for each user group (**User** and **Installer**). Tip: With PV systems in Sunny Portal, you can also assign a new password via Sunny Portal for the user group **Installer**. The password for the user group **Installer** is the same as the system password in Sunny Portal.

Procedure:

- 1. Request PUK (application form available at www.SMA-Solar.com).
- 2. Activate the user interface (see Section 9.1, page 40).
- 3. Enter the PUK instead of the password into the field **Password**.
- 4. Select Login.
- 5. Call up the menu **Device Parameters**.
- 6. Select [Edit parameters].
- 7. In the parameter group **User Rights > Access Control** change the password of the desired user group.
- 8. Select [Save all] to save the changes.

i PV Systems in Sunny Portal

The password for the user group **Installer** is also the system password for the PV system in Sunny Portal. Changing the password of the user group **Installer** can lead to the inverter no longer being able to be reached by Sunny Portal.

 Assign the changed password of the user group Installer as the new system password in Sunny Portal (see the Sunny Portal user manual at www.SMA-Solar.com).

12.2 Event Messages

Event number	Message, cause and corrective measures
101	▲ QUALIFIED PERSON
102 103 105 202 203 206	Grid fault The grid voltage or grid impedance at the connection point of the inverter is too high. The inverter has disconnected from the utility grid. Corrective measures: Check whether the grid voltage at the connection point of the inverter is permanently in the permissible range. If the grid voltage is outside the permissible range due to local grid conditions, contact the grid operator. The grid operator must agree with an adjustment of the voltage at the feed-in point or with a change of the monitored operating limits. If the grid voltage is permanently within the permissible range and this message is still displayed, contact Service.
301	
301	Grid fault The ten-minute average value of the grid voltage is no longer within the permissible range. The grid voltage or grid impedance at the connection point is too high. The inverter disconnects from the utility grid to maintain power quality. Corrective measures: During the feed-in operation, check whether the grid voltage at the connection point of the inverter is permanently in the permissible range. If the grid voltage is outside the permissible range due to local grid conditions, contact the grid operator. The grid operator must agree with an adjustment of the voltage at the feed-in point or with a change of the monitored operating limits. If the grid voltage is permanently within the permissible range and this message is still displayed, contact Service.

Event number Message, cause and corrective measures 302 A QUALIFIED PERSON Active power limited AC voltage The inverter has reduced its power due to a too-high grid voltage to ensure grid stability. Corrective measures: If possible, check the grid voltage and observe how often fluctuations occur. If fluctuations occur frequently and this message is displayed often, contact the grid operator and request approval to change the operating parameters of the inverter. If the grid operator gives his approval, discuss any changes to the operating parameters with Service (see Section 16, page 86). 401 **A QUALIFIED PERSON** 404 Grid fault The inverter has disconnected from the utility grid. A stand-alone grid or a very large change in the power frequency was detected. Corrective measures: • Check the grid connection for significant short-term frequency fluctuations. 501 A QUALIFIED PERSON Grid fault The power frequency is not within the permissible range. The inverter has disconnected from the utility grid. Corrective measures: • If possible, check the power frequency and observe how often fluctuations occur. If fluctuations occur frequently and this message is displayed often, contact the grid operator and request approval to change the operating parameters of the inverter.

Operating manual SHP-20-BE-en-10 57

operating parameters with the Service.

If the grid operator gives his approval, discuss any changes to the

Event number

Message, cause and corrective measures

507

A QUALIFIED PERSON

Active power limited AC frequency

The inverter has reduced its power due to a too-high power frequency to ensure grid stability.

Corrective measures:

If possible, check the power frequency and observe how often
fluctuations occur. If fluctuations occur frequently and this message is
displayed often, contact the grid operator and request approval to
change the operating parameters of the inverter. If the grid operator
gives his approval, discuss any changes to the operating parameters with
Service (see Section 16, page 86).

601

A QUALIFIED PERSON

Grid fault

The inverter has detected an excessively high proportion of direct current in the grid current.

Corrective measures:

- Check the grid connection for direct current.
- If this message is displayed frequently, contact the grid operator and check whether the monitoring threshold on the inverter can be raised.

701

A QUALIFIED PERSON

Frq. not permitted > Check parameter

The power frequency is not within the permissible range. The inverter has disconnected from the utility grid.

Corrective measures:

 If possible, check the power frequency and observe how often fluctuations occur.

If fluctuations occur frequently and this message is displayed often, contact the grid operator and request approval to change the operating parameters of the inverter.

If the grid operator gives his approval, discuss any changes to the operating parameters with Service (see Section 16, page 86).

Event number	Message, cause and corrective measures			
1302	▲ QUALIFIED PERSON			
	Waiting for grid voltage > Installation failure grid connection > Check grid and fuses			
	L not connected.			
	Corrective measures:			
	Ensure that L is connected.			
	Ensure that the circuit breaker is switched on.			
	 Ensure that the AC cable is not damaged and that it is connected correctly. 			
1501	▲ QUALIFIED PERSON			
	Reconnection fault grid			
	The changed country data set or the value of a parameter you have set does not correspond to the local requirements. The inverter cannot connect to the utility grid.			
	Corrective measures:			
	 Ensure that the country data set has been configured correctly. To do this, select the parameter Set country standard and check the value. 			
3302	▲ QUALIFIED PERSON			
3303	Unstable operation			
	There is not enough power at the DC input of the inverter for stable operation.			
	The inverter cannot connect to the utility grid.			
	Corrective measures:			
	 Ensure that the PV array is designed correctly. 			
	• Ensure that the PV array is not covered by snow or otherwise shaded.			
	 Ensure that the PV array is free of errors. 			

Event number Message, cause and corrective measures

3401 A QUALIFIED PERSON

DC overvoltage > Disconnect generator

Overvoltage at the DC input. This can destroy the inverter.

This message is signalized additionally by rapid flashing of the LEDs.

Corrective measures:

- Immediately disconnect the inverter from all voltage sources.
- Check whether the DC voltage is below the maximum input voltage of the inverter. If the DC voltage is below the maximum input voltage of the inverter, reconnect the DC connectors to the inverter.
- If the DC voltage exceeds the maximum input voltage of the inverter, ensure that the PV array has been correctly rated or contact the installer of the PV array.
- If this message is repeated frequently, contact the Service.

3501 **A QUALIFIED PERSON**

Insulation failure > Check generator

The inverter has detected a ground fault in the PV array.

Corrective measures:

• Check the PV system for ground faults.

3601 **▲ QUALIFIED PERSON**

High discharge curr. > Check generator

The leakage current of the inverter and the PV array is too high. There is a ground fault, a residual current or a malfunction.

The inverter interrupts feed-in operation immediately after exceeding a threshold. When the fault is eliminated, the inverter automatically reconnects to the utility grid.

Corrective measures:

• Check the PV system for ground faults.

3701 **▲ QUALIFIED PERSON**

Resid.curr.too.high > Check generator

The inverter has detected a residual current due to temporary grounding of the PV array.

Corrective measures:

· Check the PV system for ground faults.

Event number	Message, cause and corrective measures			
3901	▲ QUALIFIED PERSON			
3902	Waiting for DC start conditions > Start cond. not met			
	The feed-in conditions for the utility grid are not yet fulfilled.			
	Corrective measures:			
	 Ensure that the PV array is not covered by snow or otherwise shaded. 			
	Wait for higher irradiation.			
	 If this message is displayed frequently in the morning, increase the voltage limit for starting grid feed-in. Change the parameter Critical voltage to start feed-in. 			
	 If this message is displayed frequently with medium irradiation, ensure that the PV array is correctly rated. 			
6001 to 6438	▲ QUALIFIED PERSON			
	Self diagnosis > Interference device			
	The cause must be determined by the Service.			
	Corrective measures:			
	Contact the Service.			
6501	▲ QUALIFIED PERSON			
6502	Self-diagnosis > Overtemperature			
	The inverter has switched off due to excessive temperature.			
	Corrective measures:			
	 Clean the cooling fins on the rear of the enclosure and the air ducts on the top using a soft brush. 			
	 Ensure that the inverter has sufficient ventilation. 			
	Ensure that the inverter is not exposed to direct solar irradiation.			
6511	▲ QUALIFIED PERSON			
	Overtemperature			
	An overtemperature has been detected in the choke area.			
	Corrective measures:			
	 Clean the cooling fins on the rear of the enclosure and the air ducts on the top using a soft brush. 			
	Ensure that the inverter has sufficient ventilation.			
	Ensure that the inverter is not exposed to direct solar irradiation.			
6512	Minimum operating temperature not reached			
	The inverter will only recommence grid feed-in once the temperature has reached at least -25°C.

	The parameter changes are being adopted.
27104	Parameters set successfully
	The parameter changes were successfully adopted.
27107	Update file OK
	The update file found is valid.
27301	Update communication
	The inverter is updating the communication component.
27302	Update main CPU
	The inverter is updating the inverter component.
27312	Update completed
	The inverter has successfully completed the update.
27329	Condition test successful
29001	Inst. code valid
	The entered Grid Guard code is valid. Protected parameters have now been unlocked and you can adjust the parameters. The parameters will be automatically locked again after ten feed-in hours.
29004	Grid parameters unchanged
	Changing the grid parameters is not possible.

12.3 Checking the PV System for Ground Faults

A QUALIFIED PERSON

If the red LED is glowing and the event number 3501, 3601 or 3701 is being displayed in the **Results** menu on the inverter user interface, there may be a ground fault present. The electrical insulation from the PV system to ground is defective or insufficient.

A DANGER

Danger to life due to electric shock when touching live system components in case of a ground fault

If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

- Disconnect the product from voltage sources and make sure it cannot be reconnected before working on the device.
- Touch the cables of the PV array on the insulation only.
- Do not touch any parts of the substructure or frame of the PV array.
- Do not connect PV strings with ground faults to the inverter.

NOTICE

Destruction of the measuring device due to overvoltage

Only use measuring devices with a DC input voltage range of 1500 V or higher and an AC input voltage range of 600 V or higher.

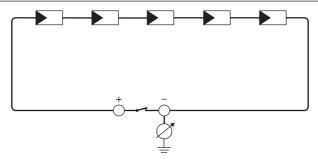

Figure 14: Schematic diagram of the measurement

i Calculating the insulation resistance

The expected total resistance of the PV system or of an individual string can be calculated using the following formula:

$$\frac{1}{R_{\text{total}}} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \dots$$

The exact insulation resistance of a PV module can be obtained from the module manufacturer or the datasheet.

For the resistance of a PV module an average value can be assumed: for thin-film PV modules approximately 40 MOhm and for polycrystalline and monocrystalline PV modules approximately 50 MOhm per PV module (for further information on calculating the insulation resistance see the Technical Information "Insulation Resistance (Riso) of Non-Galvanically Isolated PV Systems" at www.SMA-Solar.com).

Required devices:

- ☐ Suitable device for safe disconnection and short-circuiting
- ☐ Measuring device for insulation resistance

i Device required for safe disconnection and short-circuiting of the PV array

The insulation resistance can only be measured with a suitable device for safe disconnection and short-circuiting of the PV array. If no suitable device is available, the insulation measurement must not be carried out.

Procedure:

1. Calculate the expected insulation resistance per string.

2. A DANGER

Danger to life due to high voltages

- Disconnect the inverter from all voltage sources (see Section 10, page 52).
- 3 Install the short circuit device
- 4. Connect the measuring device for insulation resistance.
- 5. Short-circuit the first string.
- 6. Set the test voltage. The test voltage should be as close as possible to the maximum system voltage of the PV modules but must not exceed it (see datasheet of the PV modules).
- 7. Measure the insulation resistance.
- 8. Eliminate the short circuit.
- 9. Measure the remaining strings in the same manner.
 - ☑ If the insulation resistance of a string deviates considerably from the theoretically calculated value, there is a ground fault present in that string.
- 10. Reconnect to the inverter only those strings from which the ground fault has been eliminated.
- 11. Reconnect all other strings to the inverter.

- 12 Recommission the inverter
- 13. If the inverter still displays an insulation error, contact the Service (see Section 16, page 86). The PV modules might not be suitable for the inverter in the present quantity.

12.4 Replacing the Surge Arrester

A QUALIFIED PERSON

1

A DANGER

Danger to life due to high voltages

- Disconnect the inverter from all voltage sources (see Section 10, page 52).
- 2. Pull all surge arresters out of the slots.

- Dispose of all surge arresters in accordance with the locally applicable disposal regulations for electronic waste.
- 4. Insert new surge arresters.

73

- 5. Ensure that each surge arrester is securely inserted into its slot.
- 6. Recommission the inverter (see Section 8.2, page 35).

12.5 Activate the diagnostic function in the event of a defective Speedwire communication

If several Speedwire devices in line topology are connected to each other in the system and the Speedwire communication does not function properly, you have the option of activating diagnostic functions for simple troubleshooting.

The following diagnostic functions are available:

- Activate Speedwire communication display on the inverter
- Test Speedwire communication via SMA Data Manager

Activate Speedwire communication display on the inverter

By activating this diagnostic function, the inverter can signal that one network cable is connected by the blue LED flashing. This allows you to quickly check whether the network cable is plugged in for inverters where only one network cable is to be connected, and whether only one rather than two network cables are connected for inverters where two network cables are to be connected.

Procedure:

- In the parameter group Device > Operation, select the parameter Ethernet link diagnostic via LED and set this to On.
 - ☑ Blue LED flashes (2 s on and 250 ms off); one network cable is connected to the inverter.
 - ☑ If the blue LED is not flashing, no network cable is connected.
- Check whether for the inverters where the blue LED is flashing there really should only be one network cable connected or whether two network cables should be connected here.
- Check whether for the inverters where the blue LED is not flashing there really should not be a network cable connected.

Test Speedwire communication via SMA Data Manager

If there is a SMA Data Manager in the system, the inverter can indicate signal whether the Speedwire communication is working properly or if there is a problem by the red LED flashing. The diagnostic function can only be activated via the user interface of the SMA Data Manager.

Procedure:

1

- Select the Communication diagnostic parameter via the Data Manager user interface and set it to On.
 - ☑ The red LED of the inverter flashes (250 ms on and 250 ms off): The communication of the Speedwire devices connected in line topology is working perfectly.
- If the inverter's red LED does not flash, the Speedwire communication is defective. The communication path must be checked.

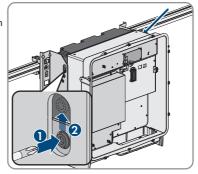

12.6 Cleaning the Fans

A QUALIFIED PERSON

A DANGER

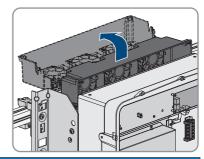

Danger to life due to high voltages

- Disconnect the inverter from all voltage sources (see Section 10, page 52).
- Release the fan bracket on the right and left of the inverter. To do so, press in the locking tabs and push them upwards.

4.

 Move the fan bracket upwards and fold it backwards. Note that the fan bracket cannot be removed completely because it is connected to the inverter by the fan cable.

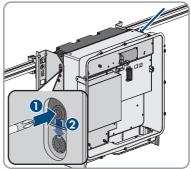

NOTICE

Damage to the fan due to compressed air

- Clean the fans with a soft brush, a paint brush, or a damp cloth.
- 5. If the cooling fins are dirty, clean them using a soft brush.
- Insert the locking tabs on the left and right of the fan bracket into the recesses and the top into the suspensions.

7. Press the fan bracket firmly downwards so that the locking tabs engage on the right and left.

7.5

13 Decommissioning the Inverter

A QUALIFIED PERSON

To decommission the inverter completely upon completion of its service life, proceed as described in this Section.

A CAUTION

Risk of injury due to weight of product

Injuries may result if the product is lifted incorrectly or dropped while being transported or mounted.

- Transport and lift the product carefully. Take the weight of the product into account.
- Wear suitable personal protective equipment for all work on the product.
- Transport the product using the carrying handles or hoist. Take the weight of the product into account.
- Use all carrying handles provided during transport with carrying handles.
- Do not use the carrying handles as attachment points for hoist equipment (e.g. straps, ropes, chains). Insert eye bolts into threads provided on top of the product to attach the hoist system.

Requirements:

Original packaging or packaging suitable for the weight and dimensions of the product must
be available.
A pallet must be available.
Mounting material for attaching the packaging on the pallet (e.g. tie-down straps)
All transport handles must be in place.

Procedure:

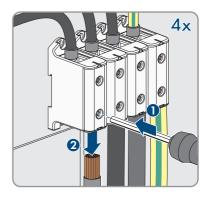

1

▲ DANGER

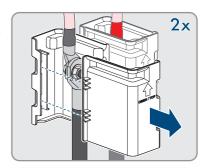

Danger to life due to high voltages

• Disconnect the inverter from all voltage sources (see Section 10, page 52).

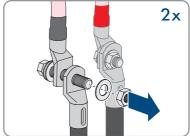

Remove the AC cable from the inverter. To do so, loosen the screws (AF8) and pull the cables out of the terminal.

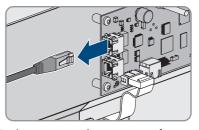

- 3. Remove the AC cable from the inverter.
- Remove the protection elements against contact from the terminal lugs for the DC connection. To do so, unlock the side brackets.

Remove the DC cable connection. Loosen the hex nuts (AF10) and remove the combined hexagon head screw (AF16).

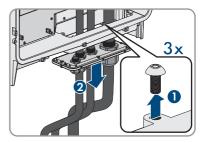

- 6. Remove the DC cables from the inverter.
- 7. Remove the network cables from the network ports and remove them from the inverter.

8. Remove all cable glands from the connecting plate. To do so, unscrew the counter nuts from inside and remove the cable glands from the opening.

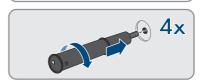

Dismantle the connecting plate. To do so, unscrew the three screws (TX40).

 Position the enclosure lid and first tighten the upperleft and lower-right screws, and then the remaining screws crosswise (TX25, torque: 6 Nm ± 0.3 Nm).

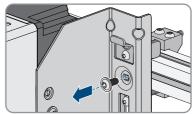

11. Screw the transport handles as far as they will go into the taps on the right- and left-hand side until they lie flush with the enclosure. When doing so, ensure that the transport handles are screwed into the taps so that they are perfectly straight. If the transport handles are not screwed in straight, this can make it more difficult or even impossible to unscrew them later on and can damage the taps to the extent that transport handles can no longer be screwed into them.

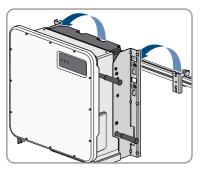

12. Insert a screwdriver into the holes in the transport handle and turn the screwdriver through 90°. This ensures that the transport handles are securely tightened.

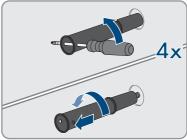

- 13. If the inverter is to be hooked into the mounting brackets by means of a hoist, screw the eye bolts into the threads on the top of the inverter and attach the hoist to them. The hoist must be suitable to take the weight of the inverter.
- Unscrew the screw for securing the product to the mounting brackets on the right and left (TX40).

 Remove the inverter from the mounting lugs of the mounting brackets by moving it upward.

16. Remove all four transport handles from the threaded holes. If necessary, insert a screwdriver into the holes on the transport handle and use the screwdriver to remove the transport handle.

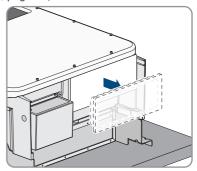

79

- 17. If the inverter is to be stored or shipped, pack the inverter and the wall mounting bracket. Use the original packaging or packaging that is suitable for the weight and dimensions of the inverter and secure with tie-down straps on the Euro pallet.
- 18. Dispose of the inverter in accordance with the locally applicable disposal regulations for electronic waste.

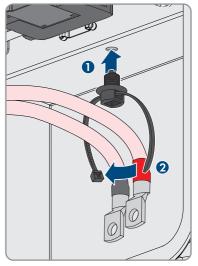

14 Procedure for Receiving a Replacement Device

Under fault conditions, the product may need to be replaced. If this is the case, you will receive a replacement device from SMA Solar Technology AG. If you received a replacement device, replace the defective product with the replacement device as described below.

- 1. To simplify the configuration of the replacement device, save the configuration data of the defective product to a file (see Section 9.10, page 49).
- 2. Decommission the defective product (see Section 13, page 76).
- Remove the transport cover, which is located in the housing opening of the replacement unit instead of the connecting plate, and use it for the defective product.

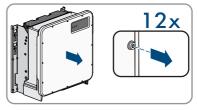

4. Secure the pre-configured DC connection cables in the defective product for transport. To do so, screw the supplied cable tie into the hole below the DC surge protection devices and place and tighten the cable tie around the DC connection cables.

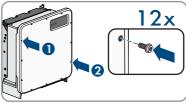

- Mount the replacement device and make the electrical connections as described in this document. Use the connection plate and the DC protection elements against contact of the defective product.
- 6. If the enclosure lid of the replacement device is a transport lid (see information on the enclosure lid), replace the transport lid of the replacement device with the enclosure lid of the defective inverter:

 Unscrew the screws of the enclosure lid (TX25) and remove it.

 Position the enclosure lid and first tighten the upper-left and lower-right screws, and then the remaining screws crosswise (TX25, torque: 6 Nm ± 0.3 Nm).

81

- 7. Commission the replacement device (see Section 8.2, page 35).
- 8. Establish a connection to the user interface (see Section 9.1, page 40).
- On the Configure inverter page, select the Adopt configuration from file configuration option and load the saved configuration file of the defective product (see Section 8.3, page 36).
- 10. If the defective inverter had been registered by a communication product, replace it with the new product in the communication product.
- 11. Pack the defective product in the packaging of the replacement device.
- 12. Fasten the packaging to the pallet on which the replacement device was supplied using the reusable lashing straps.
- 13. Arrange for pick-up with SMA Solar Technology AG.

15 Technical Data

DC input

	SHP 100-20	SHP 150-20
Maximum PV array power	150000 Wp	225000 Wp
Maximum input voltage	1000 V	1500 V
MPP voltage range	590 V to 1000 V	880 V to 1450 V
Rated input voltage	693 V	960 V
Minimum input voltage	570 V	855 V
Initial input voltage	625 V	940 V
Maximum input current	180 A	180 A
Maximum short-circuit current*	325 A	325 A
